PLAN REVIEW

Schema v1

Structured implementation plan

SUMMARY

The checked-out repository contains a single content file, `README`, whose only line reads `Hello World!`. Ticket KAN-25 asks to change the "Hello World" text (the

summary/description contain the typo "Tet", clearly meaning "Text") to "Hello AI World". The implementation is a one-line edit to `README`, updating `Hello World!` to `Hello AI World!` while preserving the existing trailing exclamation mark and newline.

TICKET TYPE

Chore

TEST STRATEGY

This is a documentation/text-only repo with no build system, test framework, or code. Verify by reading `README` after the edit and confirming line 1 is exactly `Hello AI World!` and the trailing newline is preserved. Optionally grep the repo to confirm no remaining occurrence of the standalone string `Hello World` (case-insensitive) and that `Hello AI World` is present.

Impacted files

README

The only file in the repo and the sole location containing the string "Hello World!" that the ticket wants changed.

Proposed changes

README

[Modify](#)

Change line 1 from `Hello World!` to `Hello AI World!`. Insert `AI` between `Hello` and `World!`, keeping the trailing `!` and the existing trailing newline (line 2) intact. No other lines exist or need modification.

Risks

- Minimal: the change touches a single word in a single documentation file with no

Open questions

- The ticket says "Tet" — assumed to mean "Text". Confirm this is a typo and no other interpretation is intended.
- Should the exclamation mark be retained ("Hello AI World!") or dropped ("Hello AI World")? Plan assumes it is retained to match the existing content.
- The ticket has no acceptance criteria; confirm the README is the only intended target and there are no other systems/repos expecting the old string.
