PLAN REVIEW

[Schema v1](#)

Structured implementation plan

SUMMARY

The repository contains a single content file, `README`, whose only line is `Hello World!`. Ticket KAN-25 asks to change the "Hello World" text to "Hello AI World" (the ticket's "Tet" is interpreted as a typo for "Text"). The implementation is a one-line edit to `README`, changing `Hello World!` to `Hello AI World!` while preserving the trailing exclamation mark and newline.

TICKET TYPE

Chore

TEST STRATEGY

This repo has no test harness or build tooling (only a README and .git), so no automated tests apply. Verify manually by reading `README` and confirming line 1 reads exactly `Hello AI World!` and the file still ends with a newline. Optionally confirm no other files contain 'Hello World' (a repo-wide grep returns only this file).

Impacted files

README

Contains the only occurrence of the target text 'Hello World!' on line 1; this is the file the ticket refers to.

Proposed changes

README

[Modify](#)

Risks

- Minimal risk: single-line text change in a plain README with no consumers/build steps.
- Ticket wording is ambiguous ('Tet', 'Hello World' vs 'Hello World!'); the intended result is assumed to be 'Hello AI World!' preserving the exclamation mark.

Open questions

- Should the trailing exclamation mark be preserved (i.e. 'Hello AI World!') as assumed, or is a bare 'Hello AI World' desired?
- The ticket says 'Tet' — confirmed to mean 'Text' and refers to the README content, correct?
